50

① a)

=> The main objective of computer vision is to we need to train the computer to understand the image by converting the image into computer ~~under~~ -standing format

b)

=> facial identification

* Now a days cameras can identify the human face from a huge crowd

* used by law and order and Intelligence Agencies.

=> Smart health meters:-

* which now integrate the human bp, sugar level and hp etc by using image of latest reports

② a)

=> feature extraction of image is to make the image to better quality so the image can be understood by the computer easily so it the way of extraction.

⑤ ⇒ The object recognition improve CV system by pixel values, shape, color and similar structure which are defined already in database so it is easy to improve CV system.

③ ⑥ ⇒ Low-level image processing is the first stage of image pre-processing in that it removes unwanted, noise and blur part of the images

⑥ ⇒ mid-level :-
* second stage of preprocessing to enhance the image by sharpening, cutting and contouring the image

⇒ high-level

* Third stage of pre-processing to enhance the image by brightening and enhancing the pixels.

④ ② ⇒ Pixel is a small controllable unit of component in CV to control the image or display.

⑤ ⇒ Image resolution is a format to improve the image quality but if the image resolution is beyond the content of the actual pixel it damages the image quality.

So it is ^{direct} image sensor means it can be say as the eye of the computer to detect the image by its shape, colour and figures.

⑥

=> Digital camera

=> mobile phone

⑥ ①

=> Sampling is used to convert light energy into image

=> Low sampling (fewer pixel)

=> high sampling (more pixel)

⑦

=> quantization is a intensity digitization it is used to help the image to improve in better quality so it is useful in image processing.

⑦

①

=> projection is the method of capturing the image when light falls on object and reflection to help in acquisition.

⑥

=> illumination the follows and formed part of image formation to capture the image as a clone in older days.

②

=> image processing is a step by step method to enhance, improve the image from worst to best.

⑥

=> image processing :

* is a understing of human eye to make image in a better quality as they want.

=> computer vision :-

* It is a way of how the computer syst understant the image by as the language the cor needed.

②

=> Pateint monitoring

* how the hospital stores and uses th data of there ECG, MRI for there future tretmen plan. computer vision helpful in that ways mal out easy and secure by their face index.

☞ ☞ ☞ autonomous vehicles

☞ ☞ parking and self driving

=> The way computer in the car understand the parking signs and it gives the direction to the parking and it understand the surrounds by the image sensor.

10 a

=> The pixels considered the basic building blocks of digital images because it can be control the pixel rate to improve or blur the image by the pixels.

b

=> Sampling and image resolution influence image analysis for the impromet of image to give it as a good image both are the same pa but they different by their methods.
